Dear Mr. Tussenvoegsel Achternaam,

We are excited to present this first edition of our newsletter to you. Our newsletter enables you to stay informed about product information, upcoming events, exciting news and remarkable installations.

Quattro Family - 3kVA to 10kVA

One of our most successful products is the Quattro Inverter/Charger. The two AC inputs with integrated transfer switch make this product unique in the market. With these two AC inputs you can directly connect both shore-side power and a generator to the Quattro. This eliminates the need for a separate transfer switch.

Two AC outputs

All Quattro- and several Multi Inverter/Chargers also have two AC outputs. In addition to the standard no-break output, an auxiliary output is available which disconnects the connected load during battery operation. It is, for example, the perfect solution for preventing an electric water heater from discharging your battery.

Coming Soon!

The Quattro Family will soon be extended with several new units:

- 48V / 8000VA / 110A - 100A / 100A
- 48V / 10000VA / 140A - 100A / 100A
- 12V / 5000VA / 220A - 100A / 100A

Victron Global Remote

Obtaining system information: wherever and whenever.

The Global Remote is a modem which sends alarms, warnings and system status reports to cellular phones via text messages (SMS).

It can also log data from Victron Battery Monitors, Multi's, Quattro's and Inverters to a website through a GPRS connection. The usage of this website is free of charge.

The idea is simple: you can use it to get SMS alarms from a Multi, a Battery System, or both. When monitoring the usage of batteries, it can be extremely helpful to receive under and overvoltage alarms; whenever they occur. For this purpose, the Global Remote is perfect. A prepaid SIM-card (for example) in combination with the Global Remote is adequate for remotely monitoring your system.

Giant Kites & Victron

Will we fly giant kites to harvest large amounts of energy in the future?

It might sound unlikely. But several groups of scientists from around the world are currently investigating this relatively new form of sustainable energy. Higher up in the sky winds are not only stronger, they are also more constant. A Victron Inverter was used for one of these kite experiments.
